

1 Introduction

hello world

2 Architecture choices

2.1 Semantic Analysis

Decided to incorporate small duplicate checks inside the `ClassesVisitor` for an early stopping. If the class has been defines several times, there's likely a big problem, so the compiler won't take the time to inspect every fields and methods inside it, which could potentially be all duplicated. We simply tell it is duplicated and return early, not adding this class to the symbol table for further inspections.

3 Potential improvements

If I had more time I would have enhanced the code in the following ways :

1. Make dedicated src, build folders and update the Makefile.
2. Change the lexer to only take one keyword token and use a has table to decide its content.
